

Filter denoising as preprocessing: TL;DR — five panels covering 44 iterations

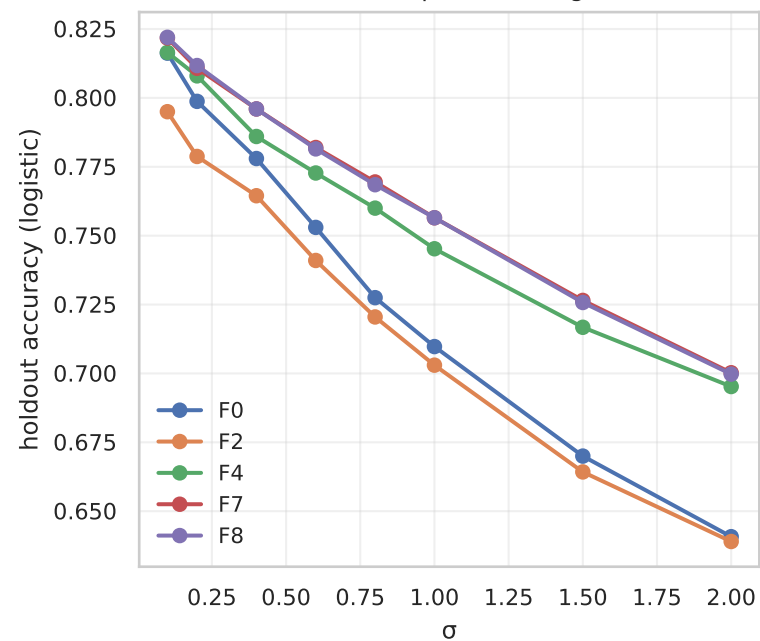

(a) Synthetic SNR gain: F0-F9 × N1-N6 (10 seeds, T=4096)

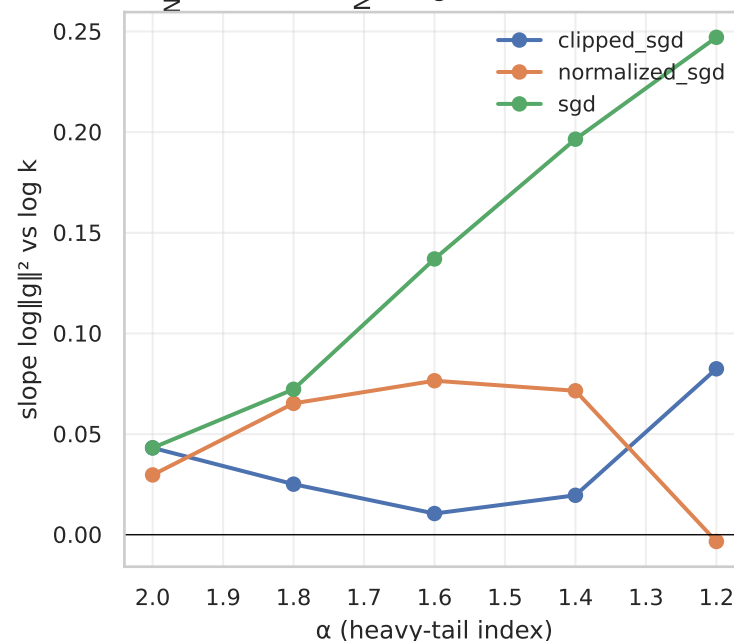

(b) Real-data: holdout MSE (Adam)
— filtering hurts

(c) σ -scan on α -stable noise
— filters help more at high σ

(d) F0 convergence slope vs α
— SGD diverges at $\alpha=1.2$

(e) Sign prediction:
lookahead vs causal — correction
